

Saumil Patel

Software / Systems Architect | Backend Engineer

github.com/SaumilP | linkedin.com/in/saumilp | saumilpgithubio.vercel.app

SUMMARY

Software and systems architect with experience designing distributed backends, Java/Spring systems, and cloud infrastructure on AWS. I design and build server-side systems - APIs, data pipelines, search, and the infrastructure that keeps them running - with a bias toward simplicity, observability, and systems that are still maintainable years later.

CORE SKILLS

Languages:	Java 21, Rust, TypeScript, Python, Shell
Frameworks & Platforms:	Spring Boot 3, Tokio (Rust async), AWS (EC2, ECS, Lambda, RDS, SQS), Fly.io, Kafka
Architecture & Practices:	Domain-driven design, Event sourcing & CQRS, Microservices, C4 modelling, Observability, TDD
Tools:	Docker, Kubernetes, Terraform, Git, GitHub Actions

SELECTED PROJECTS

draw.io Architecture Libraries

Curated draw.io shape libraries and template diagrams for AWS, C4, and microservice architectures. Enables teams to produce consistent, readable architecture diagrams.

Java Design Patterns

Annotated reference implementations of GoF and enterprise patterns in Java 21, with commentary on when each pattern helps and when it hurts.

Enterprise Spring Patterns

Production-grade Spring Boot 3 recipes covering transaction management, caching, async processing, and observability.

Mastodon Toot Client (Rust)

Async Rust CLI built on Tokio for posting to Mastodon. Demonstrates ergonomic Rust CLI design, OAuth flows, and structured error handling.

WRITING

Publishes technical notes at Machine Mind (saumilpgithubio.vercel.app/blog) covering distributed systems, backend engineering, and cloud infrastructure. Topics include Apache Solr internals, Spring Boot mechanics, Rust async patterns, AWS architecture, and developer tooling.
